DNA is a long polymer made from repeating units called nucleotides. The structure of DNA is dynamic along its length, being capable of coiling into tight loops and other shapes. In all species it is composed of two helical chains, bound to each other by hydrogen bonds. Both chains are coiled around the same axis, and have the same pitch of 34 angstroms (Å) (3.4 nanometres).

HIV RNA / DNA PCR Test a.k.a Nucleic Acid Amplification Testing (NAAT) The HIV RNA test has revolutionized HIV screening especially for people at high risk. The test directly measures the amount of HIV virus in a person's blood. This same test is also used to monitor how a person with HIV is responding to treatment. When used this way, it is called a Viral Load test.

DNA Definition. Deoxyribonucleic acid, or DNA, is a biological macromolecule that carries hereditary information in many organisms. DNA is necessary for the production of proteins, the regulation, metabolism, and reproduction of the cell. Large compressed DNA molecules with associated proteins, called chromatin, are mostly present inside the nucleus.

Answer : The correct answer is - exons. Exons can be described as the coding region (that is code for protein or peptide sequence) of the DNA or RNA molecule. They are joined together and introns (non coding sequence of DNA, which is present in eukaryotes) are spliced out before mRNA (messenger RNA) is transported to cytoplasm in eukaryotes.

RNA interference is a mechanism of eukaryotic gene regulation. In this mechanism, the enzyme "dicer" cuts dsRNA into smaller fragments called (siRNA) (ssRNA) or (dsRNA), which form a complex with RISC and degrade specific (proteins) (RNA) or (DNA)

At the very distal end of the telomere is a 300 base pair single-stranded portion, which forms the T-loop. This loop is analogous to a knot, which stabilizes the telomere, preventing the telomere ends from being recognized as break points by the DNA repair machinery.
