The oxidation state, sometimes referred to as oxidation number, describes the degree of oxidation (loss of electrons) of an atom in a chemical compound. Conceptually, the oxidation state, which may be positive, negative or zero, is the hypothetical charge that an atom would have if all bonds to atoms of different elements were 100% ionic, with no covalent component.

By defining pegmatites as igneous (London, 2008), their compositions are restricted to those that might be derived by partial melting of crustal and mantle sources. Such partial melts produce the common igneous rocks themselves, which consist mostly of three principal mineral components in or close to their eutectic proportions at elevated pressures.
