Digital photography uses cameras containing arrays of electronic photodetectors to capture images focused by a lens, as opposed to an exposure on photographic film. The captured images are digitized and stored as a computer file ready for further digital processing, viewing, electronic publishing, or digital printing.. Until the advent of such technology, photographs were made by exposing light ...

In computer vision and image processing the concept of feature detection refers to methods that aim at computing abstractions of image information and making local decisions at every image point whether there is an image feature of a given type at that point or not. The resulting features will be subsets of the image domain, often in the form of isolated points, continuous curves or connected ...

There are three types of phase response that a filter can have: zero phase, linear phase, and nonlinear phase. An example of each of these is shown in Figure 19-7. As shown in (a), the zero

phase filter is characterized by an impulse response that is symmetrical around sample zero. The actual shape doesn't matter, only that the negative numbered samples are a mirror image of the positive ...

Digital Signal Processing is distinguished from other areas in computer science by the unique type of data it uses: signals. In most cases, these signals originate as sensory data from the real world: seismic vibrations, visual images, sound waves, etc. DSP is the mathematics, the algorithms, and the techniques used to manipulate these signals after they have been converted into a digital form.

And this momentum is not showing any signs of slowing down in the near future. With startups entering previously monopolised markets and gaining major market share, to centuries-old companies that have always delivered a good service and a good product crumbling into bankruptcy it is critical to ensure you are across the upcoming digital and technological trends in business.

Today's Question: A 105mm lens on a full frame camera in FX mode has the same field of view as a 70mm lens on the same camera in DX mode. However, images won't be the same. The 105mm lens image would have more apparent compression of distance than the 70mm lens because of the real difference in focal length, and at the same aperture, the 105mm lens would have a shallower depth of field ...
