In fact, processing based on reversible reaction of covalent bonds is different from the conventional reactive processing [ , ] and solid-state processing [ , , ]. Reactive processing refers to shaping of polymers during their chemical formation associated by drastic increase in system viscosity.

You will start by filtering this solution at the beginning of the next lab period. 9. In order to ensure you have a saturated solution of  $\text{Ca}(\text{IO}_3)_2$ , the mixtures set aside from Step 8 must not contain any solid. Filter the saturated solution in the same manner as Step 2, but for this step use a clean, dry 125-mL Erlenmeyer flask to catch the filtrate.

Figure 1. You have already learned that a covalent bond forms when electrons are shared between atoms. A coordinate-covalent bond (represented by a green arrow in this diagram) forms when both of the shared electrons come from the same atom, called the donor atom (blue).. An anion or molecule containing the donor atom is known as a ligand.

Recent studies have revealed unexpected and surprising properties of the amyloid structure (). It has been shown that the beta sheet amyloid conformers self-assemble by a seeded nucleated growth mechanism characterized by an initial slow kinetic phase followed by a fast, thermodynamically favored phase in which peptide monomers/oligomers are added one by one to the growing end of the protofibril ().

Arsine (IUPAC name: arsane) is an inorganic compound with the formula  $\text{AsH}_3$ . This flammable, pyrophoric, and highly toxic pnictogen hydride gas is one of the simplest compounds of arsenic. Despite its lethality, it finds some applications in the semiconductor industry and for the synthesis

of organoarsenic compounds. The term arsine is commonly used to describe a class of organoarsenic ...

Hydrogen chloride is a diatomic molecule, consisting of a hydrogen atom H and a chlorine atom Cl connected by a polar covalent bond. The chlorine atom is much more electronegative than the hydrogen atom, which makes this bond polar. Consequently, the molecule has a large dipole moment with a negative partial charge ( $\delta^-$ ) at the chlorine atom and a positive partial charge ( $\delta^+$ ) at the hydrogen ...

1. INTRODUCTION - A transistor is a small electronic device that can cause changes in a large electrical output signal by small changes in a small input signal. That is, a weak input signal can be amplified (made stronger) by a transistor. For example, very weak radio signals in the air can be picked up by a wire antenna and processed by transistor amplifiers until they are strong enough to be ...
