Data, information, knowledge and wisdom are closely related concepts, but each has its own role in relation to the other, and each term has its own meaning. According to a common view, data is collected and analyzed; data only becomes information suitable for making decisions once it has been analyzed in some fashion. One can say that the extent to which a set of data is informative to someone ...

Data normalization is a process in which data attributes within a data model are organized to increase the cohesion of entity types. In other words, the goal of data normalization is to reduce and even eliminate data redundancy, an important consideration for application developers because it is incredibly difficult to store objects in a relational database that maintains the same information ...

Introduction to Data Normalization: A Database "Best" Practice

In business, master data management (MDM) is a method used to define and manage the critical data of an organization to provide, with data integration, a single point of reference. The data that is mastered may include reference data- the set of permissible values, and the analytical data that supports decision making.. In computing, a master data management tool can be used to support master ...

NoSQL Database Types. Document databases pair each key with a complex data structure known as a document. Documents can contain many different key-value pairs, or key-array pairs, or even nested documents. Graph stores are used to store information about networks of data, such as social connections. Graph stores include Neo4J and Giraph.

NoSQL Databases Explained | MongoDB

Catalog data where it lies. Today's enterprises are using more data than ever before from a variety of sources. As these files are typically located in disparate databases and other locations across the company, it has historically been incredibly difficult to create an all-encompassing and searchable resource of metadata from all of these sources.
