In physics, the n-body problem is the problem of predicting the individual motions of a group of celestial objects interacting with each other gravitationally. Solving this problem has been motivated by the desire to understand the motions of the Sun, Moon, planets, and visible stars. In the 20th century, understanding the dynamics of globular cluster star systems became an important n-body ...

The orbit of a planet is an ellipse with the Sun at one of the two foci.; A line segment joining a planet and the Sun sweeps out equal areas during equal intervals of time. The square of the orbital period of a planet is directly proportional to the cube of the semi-major axis of its orbit.; Most planetary orbits are nearly circular, and careful observation and calculation are required in ...

$M = Fd$, where d is the distance from the fulcrum to the line of action of the force. The torque produced by a force F is also defined as Fd . The two terms are synonymous. See Fig. 1a. In Fig. 1b the torque, or moment, produced by force F_1 is given by F_1 times its distance from the fulcrum, which is 19 feet. Thus the torque is equal to $F_1 \cdot 19$. If $F_1 = 7.2$ lbs., the torque is $7.2 \cdot 19 = 136.8$...
