Air Mass Movement. Winds push these air masses around the Earth. As they travel they bring their characteristic weather with them. For example if a mT air mass moves in over NYC it will bring with it warm humid air, so things will get hot and gross.

### **Air Masses — Mr. Mulroy's Earth Science**

As these air masses move around the earth they can begin to acquire additional attributes. For example, in winter an arctic air mass (very cold and dry air) can move over the ocean, picking up some warmth and moisture from the warmer ocean and becoming a maritime polar air mass (mP) - one that is still fairly cold but contains moisture.

### **Weather Forecasting - Air Masses and Fronts (Earth Science)**

A large body of air with the same characteristics of temperature and moisture content is known as an air mass. An air mass receives its characteristics from the location it forms, know as its source region. Fronts represent the advancing edge of the air mass at ground level. Only low pressure systems have fronts, due to air masses converging at the low pressure.

### **Weather - Regents Earth Science**

Forecasting the weather can be a tricky problem. Meteorologists gather data from many weather stations, plot the data to draw lines for air masses and pressure systems, and then analyze the map to make the forecast. The trick is that air masses move in different ways and change in ways that are not easily predicted.

### **AIR MASSES & FRONTS ACTIVITY - Mrs. Remis' Earth Science Blog**

An air mass is characterized by the weather variables that it takes from a source region. When unlike air masses collide a front is established and based on the type of air mass different weather patterns will be created. Meteorologist follow and track air masses very carefully.
