In mathematics, two varying quantities are said to be in a relation of proportionality, if they are multiplicatively connected to a constant, that is, when either their ratio or their product yields a constant. The value of this constant is called the coefficient of proportionality or proportionality constant.. If the ratio ( $y / x$ ) of two variables ( $x$  and  $y$ ) is equal to a constant ( $c = y / x \dots$

A theorem which effectively describes how lengths, areas, volumes, and generalized  $n$ -dimensional volumes (contents) are distorted by differentiable functions. In particular, the change of variables theorem reduces the whole problem of figuring out the distortion of the content to understanding the infinitesimal distortion, i.e., the distortion of the derivative (a linear map), which is given ...

2. Functions. A function is a rule for mapping the elements of one set to elements of another set. The notation  $f: A \rightarrow B$  means that  $f$  is a function that maps any element  $x$  in the set  $A$  to some element  $f(x)$  in the set  $B$ . The set  $A$  is called the domain of  $f$ , and  $B$  is called the range of  $f$ . In mathematics, the element  $x$  is called the argument, and  $f(x)$  is called the result or the image of  $x$  under the ...

The Story of Mathematics - 19th Century Mathematics - Poincaré. In the late 19th Century, Poincaré described all the possible 2-dimensional topological surfaces but, faced with the challenge of describing the shape of our 3-dimensional universe, he came up with the famous Poincaré conjecture, which became one of the most important open questions in mathematics for almost a century.
