A single plate can be made of all oceanic lithosphere or all continental lithosphere, but nearly all plates are made of a combination of both. Movement of the plates over Earth's surface is termed plate tectonics. Plates move at a rate of a few centimeters a year, about the same rate fingernails grow.

Plate tectonics is the theory that Earth's outer shell is divided into several plates that glide over the mantle, the rocky inner layer above the core. The plates act like a hard and rigid shell compared to Earth's mantle. This strong outer layer is called the lithosphere, which is 100 km (60 miles) thick, according to Encyclopedia Britannica.

Geology gives an idea of the history of the Earth by presenting basic evidence for plate tectonics, the evolutionary history of life and past climates. Geology of the Earth is the science that follows the understanding of how it is born, how it develops, how it works, and how we can help to preserve habitats. And we combine a number of other fields of science to explain a being like the Earth. topics such as physics, chemistry, mathematics, biology, computing and even geography and cartography.
