Answer: After considering the reaction  $\text{HClO}_3 + \text{NH}_3 \rightleftharpoons \text{NH}_4^+ + \text{ClO}_3^-$ , you conclude that  $\text{NH}_3$ ,  $\text{NH}_4^+$  is the base-conjugate acid pair. Explanation: When you consider the reaction  $\text{HClO}_3 + \text{NH}_3 \rightleftharpoons \text{NH}_4^+ + \text{ClO}_3^-$ , to determine which is a base-conjugate acid pair, you use the Bronsted-Lowry model for acids and bases, which is focused in the hydrogen ion ( $\text{H}^+$ ):

In chemistry, pH (/ p iː ˈ eɪ tʃ /) is a scale used to specify how acidic or basic a water-based solution is. Acidic solutions have a lower pH, while basic solutions have a higher pH. At room temperature (25 °C), pure water is neither acidic nor basic and has a pH of 7. The pH scale is logarithmic and approximates the negative of the base 10 logarithm of the molar concentration (measured ...

If you read the last post, you'll recall that a nucleophile is a species that donates a pair of electrons to form a new covalent bond. Nucleophilicity is measured by comparing reaction rates; the faster the reaction, the better (or, "stronger") the nucleophile. When discussing nucleophilicity we're specifically talking about donating a pair of electrons [...]

Evolutionists have thought of it actually, arguing that a positive test for 14 C would 'prove' that it is contaminated, since obviously a 65 Ma dino bone would have no 14 C remaining (begging the question is a common fallacy among evolutionists). See Why don't they carbon-test dino fossils? So a test would need to be on material that Dr Schweitzer has shown must be from the dinos, not ...
