Each double stranded DNA molecule holds the same genetic information. Therefore each strand can serve as a template for the construction of a new strand. The template (original) strands are separated and preserved, while the new strands are assembled from nucleotides. This is called semi-conservative replication, since each of the two resulting DNA molecules consist of one conserved old ...

In patients who are immunocompromised, CMV may cause disseminated, severe disease. CMV is also the most common cause of congenital viral infection in humans. Quantitative PCR methods may be useful in monitoring CMV replication in immunosuppressed patients or in determining the viral load of CMV in amniotic fluid. This is a quantitative molecular test, with a linear range of 200-2,000,000 IU/mL.

You need to know the basic process of DNA replication and how it relates to the transmission and conservation of genetic information. You need to know that mutations in the DNA sequence may or may not result in phenotypic change and how mutations in gametes may result in phenotypic changes in offspring.

Formation. The replication cycle of a retrovirus entails the insertion ("integration") of a DNA copy of the viral genome into the nuclear genome of the host cell. Most retroviruses infect somatic cells, but occasional infection of germline cells (cells that produce eggs and sperm) can also occur. Rarely, retroviral integration may occur in a germline cell that goes on to develop into a viable ...
