The knapsack problem or rucksack problem is a problem in combinatorial optimization: Given a set of items, each with a weight and a value, determine the number of each item to include in a collection so that the total weight is less than or equal to a given limit and the total value is as large as possible. It derives its name from the problem faced by someone who is constrained by a fixed-size ...

The limit test, also sometimes known as the nth term test, says that if lima_n!=0 or this limit does

not exist as n tends to infinity, then the series suma_n does not converge. For example, $sum_{n=1}^{n=1}^{n}infty(-1)^n$ does not converge by the limit test. The limit test is inconclusive when the limit is zero.

Maps. A discrete-time, affine dynamical system has the form of a matrix difference equation: + = +, with A a matrix and b a vector. As in the continuous case, the change of coordinates $x \to x + (1 - A) - 1$ b removes the term b from the equation. In the new coordinate system, the origin is a fixed point of the map and the solutions are of the linear system A n x 0.
