Thus, it is possible to perform all necessary operations on any data structure. However, using the proper data structure can make the difference between a program running in a few seconds and one requiring many days. A solution is said to be efficient if it solves the problem within the required resource constraints.

These calculations assume a machine with enough memory to hold the array. Algorithm 4 solves a problem of size 1,000,000 in 3 seconds. 2.9 (a) $OO(N2)$. (b) $OO(N\log N)$. 2.10 (c) The algorithm is linear. 2.11 Use a variation of binary search to get an $OO(\log N)$ solution (assuming the array is preread).

### Data Structures and Algorithm Analysis
Every problem solving has one or other type(s) of data structure as inherent part. While calculating the complexity of solutions/algorithms, if we know the complexity of data structures, it will be handy. In this section, we will apply the complexity calculation learnt in step 3 on different data

structures learnt in step 2. 4.
