In numerical analysis, hill climbing is a mathematical optimization technique which belongs to the family of local search.It is an iterative algorithm that starts with an arbitrary solution to a problem, then attempts to find a better solution by making an incremental change to the solution. If the change produces a better solution, another incremental change is made to the new solution, and ...

Rationale. The optimization problem is to minimize (), where is a vector in , and is a differentiable scalar function. There are no constraints on the values that can take.. The algorithm begins at an initial estimate for the optimal value and proceeds iteratively to get a better estimate at each stage.. The search direction p_k at stage k is given by the solution of the analogue of the Newton ...
